DETAILED ACTION

Response to Arguments

Applicant's arguments with respect to claims 1-2, 4-6, 8-10, 12-15, 17, 19-20 and 22-24 have been considered but are moot in view of the new ground(s) of rejection.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-2, 4-6, 8-10, 12-15, 17, 19-20 and 22-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dam et al. (4,192,318) in view of Cole, Jr. (US Patent No. 4,887,609). Dam discloses a method and apparatus for automatically locating the QRS portion of an electrocardiographic signal (EKG) and for generating a corresponding synchronization pulse (see Abstract). As illustrated in Figure 3A, an input signal is introduced to a circuit comprising a time delay and a comparator. The time delay is of a known value, and is demonstrated in Figure 3B as t_d . The comparator output signal is used to trigger a conventional pulse shaping network that creates the synchronization pulse. While Dam provides for the localizing of the QRS portion of an EKG, Dam fails to provide for triggering an imaging device with the synchronization signal. Cole teaches an apparatus and method for filtering the EKG signal of a patient of unwanted signals, such as contamination signals produced by the use of nuclear

magnetic resonance imaging (MRI) systems (*see* Abstract). Line 6 of Figure 2 illustrates a means for transmitting an enabling signal to MRI equipment, wherein the enabling signal can be used to synchronize the activation and deactivation of MRI equipment for use for sampling or collecting data (column 6, lines 23-39). It would have been obvious to one having ordinary skill in the art at the time the invention was made to incorporate the teachings of Cole, specifically the use of triggering a MRI system, with an automatically detected QRS portion of an EKG, as disclosed by Dam, because it is often desirable to use MRI equipment for data acquisition during specific periods within the QRS waveform of the patient's cardiovascular cycle (column 3, lines 65-67).
